PRODUCT REQUIREMENTS DOCUMENT

epsingh.in

Personal portfolio redesign: identity, evidence, SEO equity and lead conversion

Target site https://epsingh.in **Owner** Ekansh Pratap Singh **Version** 0.1 (draft) **Date** 1 Oct 2026

1. Executive Context

epsingh.in is the personal portfolio of Ekansh Pratap Singh. Observed on 1 Oct 2026, it presents three different identities at once (Frontend Developer in the title and meta tags, "MCA Student" on every sub-page and blog post, and "AI & Python Developer" with "MCA Graduate" on the homepage body and footer). It also carries three near-identical city landing pages with unverified claims. These reduce credibility for recruiters and create quality risk for search.

Owner-supplied facts (not yet visible on the live site, so to be confirmed before publishing): web development is the primary role; AI with Python is a secondary, in-progress direction; MCA completed May 2026; BCA at Dr. Ram Manohar Lohia Avadh University; currently training in AI using Python at DUCAT, Greater Noida West. The site must state this plainly and not claim more.

Mandated changes: the primary layout and the colour system must change. The final palette will be supplied by the owner; until then the build uses design tokens only (section 6). Tone must read as a focused developer with evidence, not a template or a "vibe-coded" site.

2. Current-State Snapshot

Area	Current state / observed requirement
Stack / hosting	Appears to be static HTML (links use /index.html and .html). Repo, build, hosting, redirects: **TODO / needs verification**.
Homepage headline and tone	H1 "Designing Future Interfaces"; tagline "BUILD • VIBE • REPEAT"; emoji badges (e.g. "MCA GRADUATE", "BUILDING REAL-WORLD PROJECTS").
Identity conflict	Homepage title/meta: "Frontend Developer ... MCA Student". Homepage About and footer: "MCA Graduate and AI & Python Developer". Lucknow, Gonda, Ayodhya pages, creators page and all 3 blog posts: "MCA student" / "Frontend Developer".
AI claims	"Current Focus" lists Generative AI, LLM applications, RAG & vector databases, AI automation. No AI project or evidence observed in fetched HTML. Conflicts with owner's "currently training" status.
Skills, Journey, Projects, Testimonials, Impact	Section headings exist (project filters: ALL / AI-GENAI / WEB / Tools), but content was **not present in fetched HTML**, likely JavaScript-rendered. Contents: **TODO / needs verification**. Crawler visibility: **TODO** (check rendered HTML in Search Console).
Impact counters	Headings show "10 Projects, 30 Repos, 10 Skills, 2 Team Apps". No source observed. **TODO: verify or remove.**
Homepage metadata	Description includes "Expert in HTML, CSS, JavaScript, React. Hire the best web developer in Lucknow, Gonda, Ayodhya" and the alias "(Ayush Singh)". Long meta-keywords list (includes "best web developer UP"), plus geo/ICBM/revisit-after tags. Canonical https://epsingh.in/ present. OG image preview-light.png (1200x630).
City pages	/web-developer-lucknow, /web-developer-gonda, /web-developer-ayodhya: same template, "Best Web Developer in X" titles, neighbourhood lists, claims such as "building websites for clients across India", "Hindi support", hotel/tourism specialisation. No client work observed. Footer labels them "Services".
Creators page	/website-developer-for-creators. Claims "Through DevArea, I have helped creators establish their online presence" (no evidence observed). Footer reads © 2025; other pages © 2026.
Blog	/blog/ with 3 posts, all dated 31 Jan 2026: /blog/how-to-become-frontend-developer, /blog/best-web-development-tools, /blog/why-creators-need-website. Generic evergreen topics. Contains unsourced statistics (e.g. "over 70% of developers use VS Code", creators "lost 50% of their views") and first-person claims ("after years of trying different tools", "the exact roadmap I followed") that must be checked against the owner's real history.
URL hygiene	Sub-pages link home as /index.html while canonical is /; the creators blog post links to /website-developer-for-creators.html. Duplicate-URL and redirect behaviour: **TODO**.
Contact	mailto ekanshprataps@gmail.com and an on-page form ("Send Message", "Message sent!"). Whether the form delivers anywhere: **TODO**.
Social links observed	GitHub /Ekanshps; LinkedIn /in/ekanshsinghyt; Instagram /ekansh.pratap; YouTube @devareayt; X creator tag @devareayt. Owner brief lists different handles (DevAreaYT, @DevArea, area.dev): **conflict, TODO owner to confirm which are canonical**.
Not observed	Resume link, DUCAT, BCA/university, CodePen link, structured data, sitemap.xml, robots.txt, analytics, image alt text, CSS/colour/layout. All **TODO / needs verification**.
Location	Footer: "Made with love in Lucknow"; training is in Greater Noida West. Current city: **TODO owner to confirm**.

3. Product Goals

Primary goal. Make the role and credibility of Ekansh Pratap Singh obvious within seconds: web developer, MCA graduate, learning AI with Python, backed by real projects, repositories and a working contact path.

Secondary goals

- Rank first for brand queries ("Ekansh Pratap Singh") and build a consistent entity across site and profiles.

- Generate qualified enquiries from recruiters and from small businesses and creators who need a website.
- Retain existing useful content, URLs and links through a migration map.
- Replace unverifiable claims with evidence or remove them.

Explicit non-goals

- No agency positioning, no "best/expert/top" superlatives, no skill bars or percentage ratings.
- No city-keyword doorway pages; no new location pages.
- No framework migration unless it measurably reduces duplication or improves performance.
- No publishing volume for its own sake; no AI-generated filler articles.
- No fabricated projects, clients, testimonials, metrics, certifications or AI expertise.

4. Target Audiences & Intent

Audience	What they need to see	Primary CTA
Recruiters / HR	Name, role, graduation date, current training, 3-6 projects with live links and repos, resume, location and availability. Readable in under 30 seconds.	Download resume / Email
Hiring engineers	Code quality evidence: repositories, case studies with decisions and trade-offs, honest stack list separated into used vs learning.	View project / View source
Leads who want a website built	What he builds, past work they can open, process, scope, how to start. Only claims that are true; no invented pricing or client list.	Start a conversation (form or email)
Creators (DevArea niche)	Real creator or community sites built, if any; what a creator site includes; how DevArea relates to the owner.	Contact about a project
Name-search visitors	Same facts as LinkedIn/GitHub, consistent name, verified profile links.	Visit GitHub / LinkedIn

5. Information Architecture

Homepage section order: 1 Header / nav; 2 Hero (name, role, direction, CTAs); 3 Selected work (3-6 projects); 4 About (facts, education, training); 5 Skills (two tiers: used in projects / learning); 6 AI with Python (what is being studied, labelled as learning); 7 Journey (BCA, web projects, MCA May 2026, AI training); 8 Proof (GitHub, live links, repos, only real testimonials); 9 Currently building (DevArea, factual one-liner); 10 Contact; Footer.

Recommended dedicated pages and URL migration map. No indexed URL is deleted or renamed without a 301 and an entry below.

Existing / proposed URL	Action	Condition / note
/	Keep, redesign	Canonical homepage. Ensure /index.html 301s to / (TODO verify).
/projects/[slug]	New	One page per significant project, built from the data contract (section 7). Lowercase hyphenated slugs.
/services (new, optional)	New	Single, honest page for website enquiries. Target for any consolidated city pages.
/blog/ and 3 post URLs	Keep URLs, revise	See section 9. Fix internal link to the .html variant of the creators page.
/website-developer-for-creators	Keep URL, rewrite	Keep the niche; remove unevidenced "I have helped creators" claims unless backed by a real project.
/web-developer-lucknow, /-gonda, /-ayodhya	Decision gate, Phase 1	Check Search Console clicks/impressions first. Default: 301 all three to /services with a single, evidence-based paragraph on location; if one has real traffic, keep it but rewrite without superlatives or invented specialisations. Never return 404.
/resume.pdf (TODO: file needed)	New	Linked from hero and contact. Set PDF title/author metadata.
/404	New	Branded page that returns HTTP 404 and links home and to projects.

6. Homepage Requirements

Hero copy direction. One H1 that states the role plainly. Direction: name, "Web developer", one sentence on what he builds, then "MCA graduate (2026). Currently training in AI with Python." Remove "Designing Future Interfaces" and "BUILD • VIBE • REPEAT". Final copy requires owner approval; wording must be factual, not aspirational.

CTAs. Primary: "View projects". Secondary: "Email me". Tertiary: "Resume (PDF)" once the file exists. Buttons are rectangular with a small radius (2-4px), no pill shapes, no glow; plain text links for tertiary actions.

Proof. GitHub profile, live URLs, repository links, dated work. Impact counters are removed unless each number is sourced (for example, a GitHub query the visitor can follow). Testimonials appear only if real and permitted.

Projects. 3-6 items presented as a numbered index (title, one-line summary, role, stack, live, source), not a grid of identical cards. AI-related projects appear only if an actual project exists.

Skills. Two lists: "Used in projects" (each links to a project that shows it) and "Learning". No percentages, bars or star ratings. No skill appears that is not evidenced or confirmed by the owner. Phrases such as "RAG", "LLMs", "Vector databases" stay in "Learning" until a project exists.

Layout and colour (mandatory change). Move from the current look (not inspected at CSS level: **TODO**) to an editorial, left-aligned, grid-ruled layout: hairline dividers, numbered sections, wide text column, project list as rows. No purple or violet gradients, no glassmorphism, no floating shapes, no decorative emoji. **Palette: pending owner input.** Implement as CSS custom properties only (bg,

surface, text, muted, accent, border, focus) so the final palette is a one-file change. Any palette must meet WCAG AA contrast. Light/dark toggle is optional; keep it only if both themes are tested.

7. Project Data Contract

Each project is one record in a data file (JSON or Markdown front matter). Pages render from the record. Empty fields render nothing.

Field	Rule
slug, title, summary (one line), type (web / AI / tool), status (live / archived / in progress)	Required. Slug lowercase-hyphenated and permanent.
role, team_size, contribution_notes	Required. State exactly what the owner did; mark team projects as team projects.
start_date, end_date, last_verified	Required. ISO dates. last_verified is the date a human checked links and claims.
stack (list), problem, solution, architecture_notes, challenges, learning	Required for case-study pages; otherwise optional.
outcome / metrics	**Optional and empty by default.** Only with a verifiable source (analytics screenshot, repo stats, user-confirmed figure) in evidence_links.
live_url, repo_url, evidence_links	At least one of live_url or repo_url must resolve (checked in CI). No placeholder URLs.
screenshots[] (src, width, height, alt)	Real screenshots only. Dimensions required (prevents layout shift). Alt describes content, not keywords.
related[] , tags[], featured, order	Related must reference existing slugs.
seo_title, seo_description, canonical, schema_type	Unique per project. schema_type only if accurate (SoftwareSourceCode or CreativeWork).
draft (boolean)	Any record containing a TODO value must be draft: true and is excluded from the sitemap and navigation.

Rule: never fabricate a value. Unknown means null or TODO. Do not infer metrics, users, clients, dates or roles from context.

8. SEO Strategy

Expectation. Brand queries are realistically winnable. Generic queries such as "web developer Lucknow" are highly competitive and no ranking is guaranteed; success is measured in Search Console, not promised.

Entity. Use one name, "Ekansh Pratap Singh", in title, H1, About, footer, schema, author tags and profiles. Remove "Ayush Singh" from titles and descriptions; add it as schema alternateName only if the owner confirms it is a real, used name. Person schema (name, url, jobTitle, sameAs for real profiles, alumniOf only if verified) on the homepage; WebSite and ProfilePage on /; BreadcrumbList on sub-pages; BlogPosting for posts. Schema must match visible text.

Topical clusters. (1) Web/frontend build notes and case studies. (2) Python and AI learning notes, clearly labelled as learning. (3) Websites for creators via DevArea, only with real work.

Search intent and keyword mapping (use naturally, once where meaningful; no repetition):

Page	Intent	Primary / supporting terms
/	Navigational (brand)	Ekansh Pratap Singh; web developer; frontend developer; MCA graduate; AI with Python
/projects/[slug]	Evidence	Project-specific stack and problem terms (e.g. JavaScript, React, Python only if used)
/services	Commercial	website developer, freelance web developer India; Lucknow mentioned once, only if truthful
Homepage AI section or /ai	Informational	AI using Python, learning AI development; "AI engineer" avoided until evidence exists
/blog/*	Informational	Per-article topic from first-hand experience

On-page. Unique title (about 60 characters), description (about 150), one H1 and a logical H2 hierarchy per page. Provisional homepage title: "Ekansh Pratap Singh | Web Developer" (owner to approve after copy is final). Remove the meta-keywords tag and geo/ICBM/revisit-after tags (no benefit identified). Descriptive anchors ("View project", "View source code"); never "click here".

Technical SEO. Content must be present in the initial HTML (no JS-only sections). Enforce one URL form (trailing slash policy; the blog uses a slash, other pages do not) and one host (HTTPS, www or non-www). sitemap.xml lists only canonical, indexable URLs; robots.txt references it and does not block CSS, JS or images. Real 404 status. Verify in Search Console and Bing Webmaster Tools. Current sitemap, robots and structured data: **TODO / needs verification**.

Internal linking. Home to projects, About, Contact; project to related projects, repo, live site; blog post to the relevant project or /services. Remove the footer "Services" list of city pages.

Backlinking (earned and legitimate only). Link the site from GitHub profile and repo "website" fields, LinkedIn, YouTube and Instagram bios, CodePen; project READMEs link to case studies; cross-post articles to dev platforms with canonical pointing to epsingh.in; training-institute or university alumni listings if offered. No link buying, directory spam or comment spam.

GEO / AEO. Open About with a plain factual statement (who, role, education, location, current training) that matches schema and profiles. Keep facts identical across platforms. Use FAQ-style content only for real questions, visibly on the page. Show honest published and updated dates and cite sources in articles. Allow standard crawlers; any policy on AI crawlers is an owner decision (TODO). llms.txt is optional and has no demonstrated ranking effect.

9. Content & Blog Strategy

Pillars. Project build notes; Python and AI learning notes; frontend technique notes; creator-website notes tied to real DevArea work.

Article standards. First-hand experience; named author and short bio; published and updated dates; repo or demo link where relevant; every statistic sourced or removed; no padding; no claims of seniority; limited to topics the owner can substantiate.

Legacy posts. Keep all three URLs. For each: remove or source statistics, rewrite first-person claims to match the owner's actual history, replace "Frontend Developer and MCA student" with the approved bio, add an updated date, and fix the .html internal link. "How to Become a Frontend Developer" is generic and competitive: either re-anchor it in the owner's real learning path or demote it from navigation. Any removal requires a 301 entry in the migration map.

10. Technical Architecture

- **Simplicity principle.** Keep static HTML/CSS/JS unless a static site generator measurably removes duplication (shared header, footer, metadata, project pages). No framework migration without that justification recorded.
- **Separation.** Data (site.json for identity and links, projects data, redirects) separate from UI templates; SEO metadata and JSON-LD generated from data; analytics isolated in one file; no content hard-coded in templates.
- **AI-agent safety.** Agents edit data files for content changes. Protected files (redirects, robots, CNAME or host config) change only with explicit approval. CI blocks banned phrases ("expert", "best web developer", "MCA student", "Ayush" in titles) and unresolved TODO in published records. No secrets in the repo.
- **Performance budget (mobile, p75 targets).** LCP 2.5s or less, INP 200ms or less, CLS 0.1 or less. Proposed limits: JavaScript under 100 KB gzipped, hero image under 100 KB, at most 2 font families self-hosted with font-display swap, no animation library unless CSS cannot do the job, images in WebP/AVIF with width and height set, LCP image not lazy-loaded.

11. Accessibility & UX

- WCAG 2.2 AA: semantic landmarks, skip link, visible focus, text contrast 4.5:1, touch targets at least 44px on mobile.
- Keyboard-operable navigation and menu; no hover-only interactions; `lang="en-IN"`.
- Honour prefers-reduced-motion; the site must be fully usable with motion off. Motion is limited to short reveals and hover feedback.
- Forms: labelled fields, inline errors, readable status messages. Alt text for meaningful images, empty alt for decorative ones.
- Mobile-first at 320, 375, 768, 1024, 1440px; no horizontal scroll.

12. Conversion & Contact

- One contact section with email plus a short form (name, email, message, enquiry type: hiring / project). Server-side validation and spam protection; delivery service: **TODO**.
- Verify the current form actually delivers before keeping the "Message sent!" state. Show a real failure state.
- State response time only if true. No pricing language such as "affordable" or "competitive rates" unless the owner provides real terms.
- Resume linked from hero and contact; PDF metadata set (title, author).
- No client logos or testimonials unless real and approved in writing.

13. Analytics & Measurement

Tool: TODO (privacy-light option preferred). **Events:** contact_cta_click, email_click, form_submit_success, form_submit_error, resume_download, project_view, project_live_click, project_repo_click, social_click (by network), outbound_click, 404_view.

SEO KPIs: Search Console impressions and clicks for brand queries; average position for "Ekansh Pratap Singh"; indexed pages vs sitemap; non-brand queries; Core Web Vitals field data; referring domains. Capture a baseline in Phase 1, before any change.

Cadence: weekly for the first month after launch (indexing, redirects, errors), monthly afterwards, quarterly review of content and information architecture.

14. Acceptance Criteria (Definition of Done)

- Every claim on the site traces to the owner's confirmation or a visible artefact; no "MCA student", "expert" or "best" wording remains.
- One consistent identity string across title, H1, About, footer, schema, OG and social profiles.
- Every previously indexed URL either resolves 200 or 301s per the migration map; no 404s from the old sitemap.
- Homepage content is present in raw HTML (view-source check).
- Each project record meets the data contract; no fabricated metrics; all live and repo links return 200.
- Unique title, description, H1 and canonical on every indexable page; valid JSON-LD (Rich Results Test); sitemap and robots verified.
- Lighthouse mobile: performance, accessibility, SEO and best practices each 90+ (target, measured not assumed); Core Web Vitals within the budget in section 10.
- Axe or Lighthouse accessibility audit has no critical issues; keyboard-only and reduced-motion passes recorded.
- Layout and palette follow the owner-supplied scheme through tokens; no purple gradients or pill buttons.
- Contact form tested end to end; analytics events fire; Search Console and Bing verified.

15. AI Coding-Agent Context / System Prompt

```
ROLE: You are implementing the epsingh.in redesign from the PRD v0.1. Owner: Ekansh Pratap Singh.
RULE: Never invent projects, metrics, clients, testimonials, skills, certifications, employers or dates.
RULE: Use only facts from this PRD, the existing repo, or text the owner supplies. Otherwise write TODO.
RULE: Do not claim AI expertise. AI with Python is "currently training" / "learning" until a project proves more.
RULE: Never write "MCA student". Education: MCA completed May 2026 (confirm with owner).
RULE: No superlatives ("best", "expert", "top"), no skill percentages, no emoji badges, no "Build Vibe Repeat".
RULE: Preserve SEO equity. Do not delete or rename an indexed URL without a 301 and a migration-map entry.
RULE: Do not create location pages. Do not keyword-stuff. Do not hide text.
RULE: Keep the stack simple. No framework migration unless justified in writing with a measurable benefit.
RULE: Content lives in data files; templates contain no hard-coded claims.
RULE: Colours via CSS tokens only. Palette is supplied by the owner. No purple gradients, no pill buttons.
RULE: Respect prefers-reduced-motion. Keep to the performance budget in section 10.
RULE: Do not edit redirects, robots.txt or host config without explicit approval.
RULE: Never expose secrets. Validate form input server-side.
RULE: Mark unverifiable items TODO. Do not report anything as done unless it was built and tested.
OUTPUT: After each phase, list what changed, what was verified, and open TODOs.
```

16. Implementation Phases

Phase	Scope	Exit criterion
1 Audit	Repo, rendered HTML, sitemap, robots, redirects, Search Console baseline, city-page traffic decision.	Verified inventory; TODOs reduced; decision on city pages.
2 Content and evidence	Collect real project data, resume, profile handles, education and training facts, approved bio.	Records meet data contract; owner sign-off.
3 IA and design system	New layout, owner palette as tokens, type scale, components.	Static prototype approved by owner.
4 Build	Templates, data files, project pages, contact form.	All sections render from data; no hard-coded claims.
5 SEO and migration	Metadata, JSON-LD, sitemap, robots, redirect map, blog revisions.	Migration map complete; schema valid.
6 QA	Accessibility, performance, cross-browser, links, form delivery.	Section 14 checklist passes.
7 Measurement	Analytics events, Search Console and Bing, review cadence.	Baseline vs post-launch report scheduled.

17. Risks & Guardrails

Risk	Guardrail
Losing indexed pages or backlinks	Migration map; 301s; compare Search Console before and after.
Over-claiming AI skill	"Learning" tier until a project exists; owner review of every AI sentence.
Thin templated pages hurting site quality	No new location pages; resolve existing three at the Phase 1 decision gate.
Unverified legacy claims and statistics	Source or remove; owner confirms first-person statements.
Design reads as a template again	Editorial layout, owner palette, real project evidence, no decorative effects.
Agent hallucination	Section 15 rules; draft flag; CI checks; TODO instead of guessing.
Over-engineering	Stay with the simplest stack that meets the budget.
Handle mismatch (Ekanshps vs DevAreaYT etc.)	Owner confirms canonical profiles before they enter schema sameAs.

Guiding principle: clarity credibility evidence personality action.

Source note. Reviewed on 1 October 2026 (text of the served HTML): the homepage; /blog/ and its three posts; /web-developer-lucknow, /web-developer-gonda, /web-developer-ayodhya; /website-developer-for-creators. Not reviewable in this session: sitemap.xml, robots.txt, CSS/JS and JS-rendered sections, images, JSON-LD, repository, hosting, analytics, Search Console data. Education, DUCAT training, May 2026 completion and the alternate handles come from the owner's brief, not from the site. The palette will be provided by the owner.
